2.1.1 Introduction

In engineering, a truss is a structure that "consists of two-force members only, where the members are organized so that the assemblage as a whole behaves as a single object". A "two-force member" is a structural component where force is applied to only two points. Although this rigorous definition allows the members to have any shape connected in any stable configuration, trusses typically comprise five or more triangular units constructed with straight members whose ends are connected at joints referred to as nodes.

In this typical context, external forces and reactions to those forces are considered to act only at the nodes and result in forces in the members that are either tensile or compressive. For straight members, moments (torques) are explicitly excluded because, and only because, all the joints in a truss are treated as revolutes, as is necessary for the links to be two-force members.

A planar truss is one where all members and nodes lie within a two dimensional plane, while a space truss has members and nodes that extend into three dimensions. The top beams in a truss are called top chords and are typically in compression, the bottom beams are called bottom chords, and are typically in tension. The interior beams are called webs, and the areas inside the webs are called panels.

2.1.2 Objective

To study the design criteria of roof truss

2.1.3 Design of Roof truss

The forces in the members of the roof truss of an industrial building are shown in table. The truss is supported on 400mm thick masonry. End reaction due to DL + LL is 10.558kN. Members are to be connected at the joint with 16mm Φ bolts and 8mm thick gusset plate. Design members and base plate. Assume permissible bearing pressure on masonry = 0.8 N/mm² and size of shoe angle ISA 75 x 75 x 6mm on each side of gusset plate.

(40 marks)
Solution:

Design of members $L_0U_1$, $U_1U_2$, $U_2U_3$:

Maximum factored compressive force $= 1.5 \times 17.4 = 26.1$ kN

Maximum factored tensile force $= 1.5 \times 20.9 = 31.35$ kN

Length of member, $L = 1.79$ m

Effective length, $KL = 0.7 \times 1.79 = 1.253$ m
Try 2 ISA 50 x 50 x 6mm placed back to back.
The properties of angle section are:
Area, A = 2 x 568 = 1136 mm²
Minimum radius of gyration, \( r_{mg} \) = 15.1 mm

Slenderness ratio, \( \lambda = \frac{KL}{r_{mg}} \) = 1253
\( \frac{15.1}{15.1} = 82.98 < 180 \)

For \( \lambda = 82.98 \) and \( f_y = 250\text{N/mm}^2 \) from Table 8c of IS 800:2007, stress reduction for column buckling class (C) is,

By interpolation, \( \chi = 0.6 - \frac{(0.6 - 0.533) \times (82.98 - 80)}{10} = 0.58 \n\)

::: Design compressive stress is given by,

\[ f_{cd} = \frac{\chi f_y}{\gamma_m} = \frac{0.58 \times 250}{125} = 116\text{ N/mm}^2 \n\)

::: Design compressive force is given by,

\[ P_d = A f_{cd} = 1136 \times 116 \times \frac{1}{10^3} = 131.77\text{ kN} > 26.1\text{ kN} \n\nHence the section is safe in compression.

Check for Tension capacity:
Design tensile force is given by,

\[ P_t = \frac{131.77}{1.1} = 119.79\text{ kN} > 31.35\text{ kN} \n\nHence the section is safe in tension.

*Design of Bottom chord members* : L₁L₂, L₁L₃, L₂L₃,

Maximum factored compressive force = 1.5 x 14.0 = 21.0 kN
Maximum factored tensile force = 1.5 x 14.9 = 22.35 kN
Length of member, \( L = 1.55\text{m} \n\nEffective length, KL = 0.7 \times 1.55 = 1.085\text{m} \n\nTry 2 ISA 50 x 50 x 6mm placed back to back. Assume a gusset plate of 8mm thick with 16mm diameter bolts spaced at 50mm c/c.

The properties of angle section are:
Area, A = 2 x 568 = 1136 mm²

Design strength due to yielding of gross section:
As per IS800:2007 clause 6.3.2
Design strength governed by tearing or rupture at net section:

As per IS800:2007 clause 6.3.3

Assuming that the 16mm diameter bolts are provide in a single line with spacing of 50mm,

\[ a = 0.6 \] for one or two bolts.

\[ d_b = 16 \text{mm} \]

\[ d_{an} = 16 + 2 = 18 \text{mm} \]

\[ A_t = 2 \times 6 \times (50 - 18) = 384 \text{mm}^2 \]

\[ T_{dn} = \frac{\alpha A_{n f_a}}{\gamma_m} = \frac{0.6 \times 384 \times 410}{1.25 \times 10^3} = 75.57 \text{ kN} > 22.35 \text{ kN} \]

Hence the section is safe.

**Design of member U.L.**

Maximum factored compressive force = 1.5 \times 8.7 = 13.05 kN

Maximum factored tensile force = 1.5 \times 6.0 = 9.0 kN

Length of member, \( L = 3.10 \text{ m} \)

Try a single ISA 60 \times 60 \times 5\text{mm} placed back to back. Assume a gusset plate of 6mm thick with 16mm diameter bolts spaced at 50mm c/c.

The properties of angle section are:

Area, \( A = 575 \text{ mm}^2 \)

\[ d = 16 \text{mm} \]

\[ d_{an} = 16 + 2 = 18 \text{mm} \]

\( A_t = 575 \text{ mm}^2 \)

\[ A_{we} = 5 \times (60 - 18) = 210 \text{ mm}^2 \]

\[ A_w = 5 \times (60 - 5) = 275 \text{ mm}^2 \]

Design strength due to yielding of gross section:

As per IS800:2007 clause 6.3.2

\[ T_{dy} = \frac{A_{f_y}}{\gamma_m} = \frac{575 \times 250}{1.10 \times 10^3} = 130.68 \text{ kN} \]

Design strength governed by tearing or rupture at net section:

As per IS800:2007 clause 6.3.3

Assuming that the 16mm diameter bolts are provide in a single line with spacing of 50mm,
Design of RCC & Steel Structures

\[ T_{ad} = \frac{0.9 A_{u} f_{u}}{\gamma_{m1}} + \beta \frac{A_{m} f_{y}}{\gamma_{m0}} \]

\[ L_c = \text{Length of end connection} = 50 \text{mm} \]
\[ b_s = \text{shear lag width} = w + w_s - t = 60 + 30 - 5 = 85 \]
\[ \beta = 1.4 - 0.076 \left( \frac{w}{t} \right) \left( \frac{f_{y}}{f_{u}} \right) \left( \frac{b_s}{L_c} \right) = 1.4 - 0.076 \left( \frac{60}{5} \right) \left( \frac{250}{410} \right) \left( \frac{85}{50} \right) = 0.4546 \]

\[ T_{ad} = \frac{0.9 \times 210 \times 410}{1.25} + \frac{0.4546 \times 275 \times 410}{1.10} = 117041.95 \text{N} = 117.04 \text{ kN} \]

Strength governed by block shear:
As per IS800:2007 clause 6.4.1

The block shear strength \( T_{ad} \) shall be smaller of \( T_{ad1} \) and \( T_{ad2} \):

\[ T_{ad1} = \frac{A_{m} f_{y}}{\sqrt{3} \gamma_{m0}} + \frac{0.9 A_{u} f_{u}}{\gamma_{m1}} \]

\[ T_{ad2} = \frac{0.9 A_{m} f_{u}}{\sqrt{3} \gamma_{m1}} + \frac{A_{u} f_{y}}{\gamma_{m0}} \]

\[ A_{v5} = 5 \times [60 + 50] = 550 \text{ mm}^2 \]
\[ A_{v4} = 5 \times [60 + 50] - [1.5 \times 18] = 523 \text{ mm}^2 \]

\[ A_{v} = 5 \times \frac{60}{2} = 150 \text{ mm}^2 \]

\[ A_{1} = \left[ \frac{5 \times 60}{2} \right] - [0.5 \times 18] = 141 \text{ mm}^2 \]

\[ T_{ad1} = \frac{550 \times 250}{\sqrt{3} \times 1.10} + \frac{0.9 \times 141 \times 410}{1.25} = 113791.98 \text{ N} = 113.79 \text{ kN} \]

\[ T_{ad2} = \frac{0.9 \times 523 \times 410}{\sqrt{3} \times 1.25} + \frac{150 \times 250}{1.10} = 123227.78 \text{ N} = 123.23 \text{ kN} \]

\[ \therefore T_{ad} = 113.79 \text{ kN} \]

The design strength of member under axial tension is the lowest of the above three values:

\[ T_{eq} = 130.68 \text{ kN} \]
\[ T_{ad} = 117.04 \text{ kN} \]
\[ T_{ad} = 113.79 \text{ kN} \]

\[ \therefore \text{The design tensile strength of the angle} = 113.79 \text{ kN} > 9.0 \text{ kN} \]

Hence the section is safe against axial compression also.
Design of members $L_0U_0$, $L_1U_1$:

Maximum factored compressive force $= 1.5 \times 5.3 = 7.95$ kN

Maximum factored tensile force $= 1.5 \times 7.4 = 11.1$ kN

Length of member, $L = 1.79$ for $L_0U_0$

Effective length, $KL = 0.7 \times 1.79 = 1.253$ m

Try a single ISA 50 x 50 x 6 mm.

The properties of angle section are:

Area, $A = 568$ mm$^2$

Minimum radius of gyration, $r_{min} = 15.1$ mm

Slenderness ratio, $\lambda = \frac{KL}{r_{min}} = \frac{1253}{15.1} = 82.98 < 180$

For $\lambda = 82.98$ and $f_y = 250$ N/mm$^2$ from Table 8c of IS 800:2007, stress reduction for column buckling class (C) is,

By interpolation, $\chi = 0.6 - \frac{(0.6 - 0.533)}{10} \times (82.98 - 80) = 0.58$

$\therefore$ Design compressive stress is given by,

$\sigma_d = \frac{\chi f_y}{y m D} = \frac{0.58 \times 250}{1.25} = 116$ N/mm$^2$

$\therefore$ Design compressive force is given by,

$P_d = A \sigma_d = 568 \times 116 \times \frac{1}{10^3} = 65.89 > 7.95$ kN

Hence the section is safe in compression.

Check for Tension capacity:

Design tensile force is given by,

$P_d = \frac{65.89}{1.1} = 59.9$ kN $> 11.1$ kN

Hence the section is safe in tension.

Since the other members are not severely loaded, a single ISA 50x50x6 mm may be used for $U_1L_1$ and $U_2L_1$.

**Design of joints:**

Joint $L_0$:

Maximum factored force in member $L_0U_0 = 1.5 \times 20.9 = 31.35$ kN

Maximum factored force in member $L_0U_1 = 1.5 \times 14.9 = 22.35$ kN
Using 16mm diameter bolts and 8mm thick gusset plate,

d = 16mm

d_o = 16 + 2 = 18 mm

A_o = \frac{\pi \times 16^2}{4} = 201.6 \text{ mm}^2

A_{eb} = 0.8 A_o = 0.8 \times 201.6 = 160.85 \text{ mm}^2 \text{ (for ISO threads)}

Strength of bolt in shear:

AS per IS800:2007 clause 10.3.3,

The design strength of bolt \( V_{sb} = \frac{V_{eb}}{Y_{eb}} \)

\[ V_{sb} = \frac{f_{sb} (n_s A_{sb} + n_i A_{si})}{\sqrt{3}} \]

For double shear plane, \( n_s = 1, n_i = 1 \)

Strength of bolt in double shear,

\[ V_{sb} = 400 (1 \times 201.6 + 1 \times 160.8) \times \frac{1}{\sqrt{3} \times 1.125 \times 10^3} = 66.86 \text{ kN} \]

Strength of bolt in bearing:

AS per IS800:2007 clause 10.3.4,

The design strength of bolt \( V_{sbh} = \frac{V_{ebh}}{Y_{ebh}} \)

\[ V_{sbh} = 2.5 k_b d t f_s \]

Where \( k_b \) is smaller of \( \frac{e}{3d_o}, \frac{p}{3d_o} - 0.25 \frac{f_{she}}{f_s}, 1.0 \)

\( e = \) end distance = 1.7 \( d = 1.7 \times 16 = 30.6 \text{ mm} \approx 30 \text{ mm} \)

\( p = \) pitch = 50mm

\( k_b = \frac{30}{3 \times 18} = 0.5555 \)

\( k_b = \frac{50}{3 \times 18} - 0.25 = 0.6759 \)

\( k_b = \frac{400}{410} = 0.9756 \)
Design of Shoe angle at supports:

Provide 2 ISA 75 \times 75 \times 6mm shoe angle with 300mm long at support.

Factored reaction at support = 1.5 \times 10.558 = 15.84 kN

Provide minimum number of 2 bolts 16mm diameter spaced at 50mm c/c.

Design of Bearing Plate:

Assume a bearing plate length = 300mm

Width of bearing plate = 75 + 75 + 6 = 156mm

Therefore provide a bearing plate of size 300 \times 300 mm at support.

Provide masonry below bearing plate.

Allowable bearing pressure of concrete = 0.8N/mm²

\[ k_b = 1.0 \]
\[ \therefore k_b = 0.5555 \]

Design strength of joint in bearing,

\[ V_{	ext{ult}} = \frac{2.5k_b\,d\,t\,f_k}{\gamma_{mb}} = \frac{2.5 \times 0.5555 \times 16 \times 6 \times 410}{1.25} = 43728.96N = 43.72 \text{kN} \]

Hence design strength of bolt = 43.72kN

Number of bolts required = \frac{31.35}{43.72} = 0.72

Therefore provide a minimum number of 2 bolts spaced at 50mm c/c.

\textbf{Joints U}_1, \textbf{U}_2, \textbf{U}_3, \textbf{L}_1, \text{and} \textbf{L}_2 \textbf{joints;}

The member forces joining at these joints are very small when compared to joint L_n. Therefore provide a minimum number of 2 bolts spaced at 50mm c/c.
Pressure on concrete bearing pad = \( \frac{15.84 \times 1000}{300 \times 300} = 0.176 \text{ N/mm}^2 < 0.8 \text{ N/mm}^2 \)

Hence safe.
Consider 1mm width of base plate.

Bending moment about X-X = \( \frac{0.176 \times (75-6)^2}{2} = 418.97 \text{ N/mm} \)

Design bending stress, \( f_{bd} = \frac{\chi_{LT} f_y}{\gamma_m 0} = \frac{1.0 \times 250}{1.10} = 227.27 \text{ N/mm}^2 \)

Therefore thickness of plate, \( t = \sqrt{\frac{6M}{f_{bd} b}} = \sqrt{\frac{6 \times 418.97}{227.27 \times 1}} = 3.33 \text{ mm} \)

\[ \therefore \text{ Provide 6mm thick base plate.} \]

**Anchor bolts:**
Assume Pull in anchor bolt = 30.0 kN
Allowable axial tension in anchor bolt = 150 N/mm²

Area of anchor bolt required = \( \frac{30.0 \times 1000}{150} = 206 \text{ mm}^2 \)

Provide two 20mm J-anchor bolts.
Provide 22 × 50mm slot holes to allow sliding due to temperature variations.
Details of Roof Truss:

Details of Half Elevation:

Connection details at joints $L_0$:

Side View

Details of joint $L_0$
2.1.4 Outcome

One can be able to know design criteria of roof truss

2.1.5 Future study

http://nptel.ac.in/courses/105103094/
3.3.1 Introduction

Gantry girders are laterally unsupported beams to carry heavy loads from place to place at the construction sites, mostly these are of steel material.

A girder is a support beam used in construction. It is the main horizontal support of a structure which supports smaller beams. Girders often have an I-beam cross section composed of two load-bearing flanges separated by a stabilizing web, but may also have a box shape, Z shape and other forms. A girder is commonly used many times in the building of bridges.

Gantry cranes are a type of crane built atop a gantry, which is a structure used to straddle an object or workspace.

Overhead travelling cranes are used in factories and workshops to lift heavy materials equipments, etc and to carry them from one place to the other. These cranes are either hand operated or electrically operated. The crane consists of a bridge spanning the bay of the shop.

A trolley or a crab is mounted on the bridge. The trolley moves along the bridge. The bridge as a whole moves longitudinally on rails provided at the ends.

The rails on either side of the bridge rest on crane gantry girders. The gantry girders are the girders which support the loads transmitted through the travelling (moving) wheels of the cranes as shown in figure below

3.3.2 Objective

To study the design criteria of gantry girders
3.3.4 Design procedure

The design of a gantry girder is a trial method:

1. Finding the maximum wheel load on the gantry girder: The maximum wheel load occurs when the trolley is closer to the gantry girder.

\[ W_T = \text{Weight of trolley} + \text{Capacity of Crane (Hook Load)} \]

\[ W_C = \text{Weight of Crane girder/unit length} \]
**L_1** = Minimum approach of Crane hook i.e. distance between CG of gantry girder and Trolley

**L_c** = Span of Crane girder

Take \( \sum M = 0 \)

\[ R_B \times L_c = W_c \times L_c \frac{L_c}{2} + W_T \times L_1 \]

Take \( \sum V = 0 \)

\[ R_A + R_B = W_c \times L_C + W_T \]

After solving the above equations, we get,

\[ R_A = \frac{1}{L_C} \left[ \frac{W_c \times L_c^2}{2} + W_T \left( L_c - L_1 \right) \right] \]

Therefore the wheel load \( R_A \) of Crane girder is distributed on Two wheels of a gantry girder

\[ W = \frac{R_A}{2} \]

2. Finding the maximum Bending moment in the gantry girder due to vertical loads:

Maximum Bending moment,

\( BM = BM \) due to \( \text{(max. wheel load + Impact + DL of girder + Self weight of Rails)} \)

The maximum bending moment due to wheel loads occur when the CG of wheel loads are equidistant from center of gantry girder i.e. the quarter distance of the span of wheels must coincide with the center of the girder.

![Diagram](image)

Where \( L \) = Span of Gantry girder

3. Finding the maximum Shear force in the gantry girder due to vertical loads:

Maximum Shear force,

\( SF = SF \) due to \( \text{(max. wheel load + Impact + DL of girder + Self weight of Rails)} \)
The maximum shear force occurs when both wheels loads are on the girder and one of the wheels is at support.

\[ W = \frac{R_A}{2} \]

Where \( d = \) wheel base

4. Finding the maximum bending moment and shear force due to lateral forces are similar to the steps in 2 and 3 and referring to IS875(Part 2):1987
   - 10% of the weight of the crane and the maximum weight of lifted by the crane for EOT cranes.
   - 5% of the weight of the crane and the maximum weight of lifted by the crane for hand-operated cranes.

   This load should be distributed to all the wheels of the crane.

5. Selection of preliminary section of the gantry girder:
   The selection of preliminary section of the gantry girder is based on trials sections and an I-section with a channel section on its top is the most suitable built-up section for the gantry girder.

   Economical depth of the girder = \( \frac{L}{12} \)

   Compression flange width = \( \frac{L}{30} \) to \( \frac{L}{40} \) to prevent excessive lateral deflection

6. Calculate: \( I_{xy}, I_{yy} \) and \( Z_y = \frac{M_E}{F_y} \)

   \( Z_y \) of the trial section is 40% to 50% greater than the required to resist combined moment safely.

7. Check the moment capacity of section as per IS800:2007 clause 8.2.1.2.

8. Check for buckling resistance when the top flange (compression flange) is not supported as per IS800:2007 clause 8.2.2.

9. Check for local crushing for concentrated load points (wheel reactions).
Problem 1: (VTU June/July 2011, marks 70)

Design a gantry girder to an industrial shed to support an electric overhead traveling crane using the following data:

- Crane capacity = 200kN
- Weight of crane (excluding trolley) = 300kN
- Minimum approach for crane hook = 1m
- Span of gantry girder = 6m
- Height of rail section = 60mm
- Weight of crab (Trolley) = 80kN
- Span of crane girder between rails = 18m
- Wheel base = 3m
- Mass of rail section = 250N/m
- Use $f_y = 250$ MPa

Draw to a suitable scale following:

- a. Top view
- b. Front view
- c. Section of Gantry girder

Solution:

**Calculation of loads:**

1. Vertical loads:
   - Self weight of crane girder $W_c = 300$ kN
   - Self weight of crane girder per meter length, $W_c = 300/18 = 16.67$ kN/m

   Weight of Trolley = 80 kN
   Crane capacity = 200 kN
   \[ W_r = \text{Crane capacity} + \text{Weight of Trolley} \]
   \[ = 200 + 80 = 280 \text{ kN} \]

   ![Diagram showing forces and deflections]
Take $\sum M_B = 0$

$R_A \times 18 = 16.67 \times 18 \times \frac{18}{2} + 280 \times 17$

$R_A = 414.47 \text{ kN}$

This load $R_A$ is distributed on two wheels.

:. Load on gantry girder from each wheel $= \frac{414.47}{2} = 207.24 \text{ kN}$

To allow for impact etc., the above load should be increased by 25% (EOT cranes)

:. Design load $= 1.25 \times 207.24 = 259.05 \text{ kN}$

:. Factored Design load on each wheel $= 1.5 \times 259.05 = 388.58 \text{ kN}$

Lateral Loads:

Horizontal breaking load:

Horizontal force along rails = 5% of the wheel load

$= 0.05 \times 259.05 = 12.95 \text{ kN}$

Factored Horizontal load, $P_x = 1.5 \times 12.95 = 19.43 \text{ kN}$

Horizontal Surge load:

Assuming 4 wheels,

Horizontal Surge load per wheel $= 10\%$ (Hook load + Trolley load)/4.0

$= \frac{10 \times (200 + 80)}{100 \times 4} = 7 \text{ kN}$

**Calculation of Maximum Bending moment:**

*Vertical Bending Moment:*

The maximum bending moment due to wheel loads occur when the CG of wheel loads and one of the wheel loads are equidistant from center of gantry girder

$d = \text{Wheel base} = 3 \text{ m}; \quad \text{Span of Gantry girder} = 6 \text{ m}$

388.56kN

388.56kN

![Diagram showing the calculation of maximum bending moment]
Take $\sum M_A = 0$

$$R_B \times 6 = 388.56 \times 0.75 + 388.56 \times (3 + 0.75) = 1748.52$$

$\therefore R_B = 291.42 \text{kN}$

Maximum Moment will occur at E,

$$M_E = 291.42 \times (3 - 0.75) = 655.70 \text{ kN} - \text{m}$$

BM due to Dead Load of Girder:

Assume Self-weight of the Gantry girder = 2.0 kN/m

Given: Self-weight of Rails = 300 N/m = 0.3 kN/m

Total Dead Load of Girder = 2.0 + 0.3 = 2.3 kN/m

Factored Dead Load of Girder = 1.5 \times 2.3 = 3.45 \text{kN/m}$

BM due to Deal load of Girder $= \frac{WL^2}{8} = \frac{3.45 \times 6^2}{8} = 15.53 \text{ kN} - \text{m}$

$\therefore$ Factored moment due to Vertical loads = $655.70 + 15.53 = 671.23 \text{kN-m}$

Horizontal Bending Moment:

Since the procedure is same as that of Vertical BM, we can calculate the BM for horizontal loads by proportioning of vertical loads.

- $M_y = \frac{655.70 \times 7.0}{388.56} = 11.81 \text{ kN} - \text{m}$

BM due to Horizontal drag force:

Height of rail section = 60 mm = 0.06 m

Assume depth of girder = 0.6 m

Eccentricity, $e = \text{depth of girder/2.0 + Height of rail} = \frac{0.6}{2.0} + 0.06 = 0.36 \text{ m}$
L = 6.0 m

Reaction due to drag force, \( R = \frac{P_c e}{L} = \frac{19.43 \times 0.36}{6.0} = 1.17 \text{ kN} \)

Moment due to drag force \( = R \times \left( \frac{L - d}{2} \right) = 1.17 \times \left( \frac{6.0 - 3.0}{2} \right) = 2.63 \text{ kN-m} \)

Total design moment, \( M_z = 671.23 + 2.63 = 674.35 \text{kN-m} \)

**Calculation of Maximum Shear Force:**

**Vertical Shear force:**

The maximum shear force occurs when both wheels loads are on the girder and one of the wheels is at support.

![Diagram of force distribution](image)

Take \( \sum M_{ii} = 0 \)

\[ R_A \times 6 = 388.56 \times 6.0 + 388.56 \times 3.0 = 3497.4 \]

\[ \therefore R_A = 582.84 \text{kN} \]

Vertical shear due to dead load of the gantry girder \[ \frac{WL}{2} = \frac{3.45 \times 6.0}{2} = 10.35 \text{kN} \]

Horizontal shear force due to surge load:

\[ V_y = W_{surge} \left( 2 - \frac{d}{L} \right) = 7.0 \times \left( 2 - \frac{3}{6} \right) = 10.50 \text{kN} \]

\[ \therefore \text{Maximum Ultimate Reaction, } V_z = SF \text{ (Crane load + DL of Girder + Drag)} = 582.84 + 10.35 + 1.17 = 594.36 \text{kN} \]

**Selection of Preliminary Section:**

Economical depth of the girder \( \frac{L}{12} = \frac{6000}{12} = 500 \text{ mm} \)
Compression flange width = \( \frac{L}{30} = \frac{600}{30} = 200 \text{ mm} \)

Approximate Section modulus required is 40% more than the actual,

\[ Z_{p2} = 1.4 \times \frac{M_R}{f_y} = 1.4 \times \frac{674.35 \times 10^3}{250} = 3.78 \times 10^4 \text{ mm}^4 \]

Referring to Steel Table, Select ISWB600@1.311kN/m and ISMC300@3.512kN/m on compression flange as shown in figure below.

*Calculating Moment of Inertia of Gantry Girder:*

Let the distance of NA of built-up section from the tension flange (bottom) be \( \bar{Y} \).
\[
Y = \frac{\sum AY}{\sum A} = \frac{17038 \times 300 + 4564 (600 + 7.6 - 23.6)}{17038 + 4564} = 360.01 \text{ mm}
\]

\[
I_{zz,\text{gross}} = I_{zz,\text{beam}} + I_{zz,\text{channel}}
\]

\[
I_{zz,\text{gross}} = [106198.5 \times 10^4 + 17038 \times (307.6 - 247.59)^2] + [310.8 \times 10^4 + 4564 \times (247.59 - 23.6)^2] = 135542.8 \times 10^4 \text{ mm}^4
\]

\[
Z_{zz} = \frac{I_{zz,\text{gross}}}{Y_{\text{max}}} = \frac{135542.8 \times 10^4}{(600 + 7.6 - 247.59)} = 376.49 \times 10^4 \text{ mm}^4
\]

\[
I_{yy,\text{gross}} = I_{yy,\text{beam}} + I_{yy,\text{channel}}
\]

\[
I_{yy,\text{gross}} = 4702.5 \times 10^4 + 6362.6 \times 10^4 = 1106510 \times 10^4 \text{ mm}^4
\]

**Calculating Plastic modulus of section:**

\[
\text{Area} = 4564 \text{ mm}^2
\]

4564 + 250 × 21.3 + 11.2 = 250 × 21.3 + (600 - 2 × 21.3 - \bar{Y}) × 11.2

After solving the above equation, we get,

\[
\bar{Y} = 74.95 \text{ mm from lower surface of compression flange}
\]

**Plastic section modulus of section above equal area axis:**

\[
Z_{\text{top}} = Z_{\text{channel web}} + Z_{\text{channel flange}} + Z_{\text{flange}} + Z_{\text{web}}
\]
\[ Z_{\text{exp}} = \left[ 300 \times 7.6 \times \left( 74.95 + 21.3 + \frac{7.6}{2} \right) \right] \\
+ \left[ 2 \times (90 - 7.6) \times 13.6 \times (74.95 + 21.3) - \frac{(90 - 7.6)}{2} \right] \\
+ \left[ 250 \times 21.3 \times \left( 74.95 + \frac{21.3}{2} \right) \right] + \left[ 74.95 \times 11.2 \times \frac{74.95}{2} \right] \]

\[ Z_{\text{pl}} = 838.775 \times 10^3 \text{ mm}^3 \]

Plastic section modulus of section below equal area axis:

\[ Z_{P,\text{lower}} = Z_{E,\text{lower}} + Z_{I,\text{web}} \]

\[ Z_{P,\text{lower}} = \left[ 250 \times 21.3 \times \left( 600 - 21.3 - 74.95 - \frac{21.3}{2} \right) \right] \]

\[ + \left[ 11.2 \times \left( 600 - (2 \times 21.3) - 74.95 \right)^2 \right] \]

\[ Z_{P,\text{lower}} = 3929.20 \times 10^3 \text{ mm}^3 \]

\[ Z_{\text{pl}} = 838.775 \times 10^3 + 3929.20 \times 10^3 = 4767.98 \times 10^3 \text{ mm}^3 \]

Plastic section modulus of compression flange about Y-Y axis:
\[ Z_{xy} = 2Z_1 + 2Z_2 + 2Z_3 \]
\[ Z_{yy} = 2 \left[ 125 \times 21.3 \times \frac{125}{2} \right] + \frac{2}{2} \left[ 150 \times 7.6 \times \frac{150}{2} \right] + 2 \left[ 136 \times (90 - 7.6) \times \frac{150 - 136}{2} \right] \]
\[ Z_{yy} = 824.76 \times 10^3 \text{mm}^3 \]

**Classification of Section:**

Outstand of flange of I Section, \( b = \frac{b_c}{2} = \frac{250 - 11.2}{2} = 119.4 \text{ mm} \)
\[ \varepsilon = \frac{250}{f_y} = \frac{250}{250} = 1.0 \]

Referring to clause 3.7.2 and 3.7.4 Table 2 of IS800:2007,
\[ \frac{b}{t_r} = \frac{119.4}{21.3} = 5.61 < 8.4 \varepsilon \]

Thus it is a plastic section.

For plastic section \( \beta_y = 1.0 \)

**Check for Moment capacity of section:**

Local moment capacity:

Referring to clause 8.2.1.2 of IS800:2007, the local moment capacity for bending in vertical plane is given by,
\[ M_{el} = \frac{\beta_y Z_{yy} f_y}{\gamma_{mo}} \leq 1.2 Z_c \frac{f_y}{\gamma_{mo}} \]
\[ M_{el} = \frac{1.0 \times 376.49 \times 10^4 \times 250}{1.10 \times 10^6} = 1083.63 \text{ kN} \cdot \text{m} \]
\[ 1.2 \times 376.49 \times 10^4 \times \frac{250}{1.10} = 1026.79 \text{ kN} \cdot \text{m} \]
\[ \therefore M_{el} = 1026.79 \text{ kN} \cdot \text{m} > 674.35 \text{ kN} \cdot \text{m} \]

Hence the section is safe.

**Moment capacity of top flange (compression) about Y-axis:**
\[ Z_c = \frac{1}{y} \]
\[ I_y = \frac{21.3 \times 250^3}{12} + 63626 \times 10^4 = 9136.04 \times 10^3 \text{ mm}^4 \]
\[ y = \frac{300}{2} = 150 \text{ mm} \]
\[ Z_y = \frac{9136.04 \times 10^4}{150} = 609.07 \times 10^3 \text{ mm}^3 \]
\[ M_{el} = \frac{\beta_v Z_y f_y}{\gamma_{mo}} \leq 1.2 Z_{orf} \frac{f_y}{\gamma_{mo}} \]
\[ M_{el} = \frac{1.0 \times 824.76 \times 10^3 \times 250}{1.10 \times 10^6} = 187.45 \text{ kN} - \text{m} \]
\[ 1.2 \frac{Z_{orf} f_y}{\gamma_{mo}} = 1.2 \times 609.07 \times 10^4 \times \frac{250}{1.10 \times 10^6} = 166.11 \text{ kN} - \text{m} \]
\[ \therefore M_{orf} = 166.11 \text{ kN} - \text{m} \]

**Check for Combined Bending Capacity:**

\[ \frac{M_{ex}}{M_{orf}} \leq 1.0 \]
\[ \frac{674.35}{1026.79} + \frac{11.81}{166.11} \leq 1.0 \]
\[ 0.73 < 1.0 \]

Hence OK.

**Check for Buckling Resistance:**

Referring to clause 8.2.2 of IS800:2007,

The design bending strength, \( M_d = \beta_v Z_y F_{bd} \)

Referring to clause 8.2.2.1 of IS800:2007, The elastic lateral buckling strength is given by,

\[ F_{orb} = 0.1 \left( \frac{\pi^2 E}{L_\lambda} \right)^2 \left[ 1 + \frac{1}{20} \left( \frac{L_{LT}}{r_y} \right)^2 \left( \frac{h_d}{t_f} \right)^2 \right]^{0.5} \]
Where,

Overall depth of the section, \( h_t = 600 + 7.6 = 607.6 \text{ mm} \)

Effective length, \( L_{eq} = 6 \text{ m} = 6000 \text{ mm} \)

\( t_t = 21.3 + 7.6 = 28.9 \text{ mm} \)

\( L_y = 4702.5 \times 10^4 + 6362.6 \times 10^4 = 11065.1 \times 10^4 \text{ mm}^2 \)

Area, \( A = 17038 + 4564 = 21602 \text{ mm}^2 \)

\( E = 2 \times 10^5 \text{ N/mm}^2 \)

Radius of gyration, \( r_t = \sqrt{\frac{I_y}{A}} = \sqrt{\frac{11065.1 \times 10^4}{21602}} = 71.57 \text{ mm} \)

\( F_{orb} = L I \times \frac{\pi^2 \times 2 \times 10^9}{6000} \left[ 1 + \frac{1}{20} \left( \frac{6000}{7157} \right)^2 \right]^{3.5} \)

\( = 554.55 \text{ N/mm}^2 \)

Referring to Table 13.9 of IS800:2007 for \( F_{ort} = 554.55 \text{ N/mm}^2 \) and \( f_y = 250 \text{ N/mm}^2 \)

From interpolation, \( F_{ort} = 197.7 - \frac{197.7 - 188.8}{600 - 500} \times (600 - 554.55) = 193.56 \text{ N/mm}^2 \)

The design bending strength,

\( M_d = 1.0 \times 4767.98 \times 10^3 \times 193.56 \times \frac{1}{10^6} = 922.89 \text{ kN-m} \)

Hence the section is safe against buckling.

Check for Biaxial Bending:

The bending strength about Y-axis will be provided by the top flange only as the lateral loads are acting there only.

\( M_{dy} = \frac{f_y Z_{yi}}{\gamma_{mo}} \)

\( Z_{yi} = \frac{I_y}{Y} = \frac{11065.1 \times 10^4}{\left( \frac{300}{2} \right)} = 737.67 \times 10^3 \text{ mm}^3 \)

\( \therefore M_{dy} = \frac{250 \times 737.67 \times 10^3}{1.1 \times 10^6} = 167.65 \text{ kN-m} \)

\( \frac{M_{dy}}{M_{dz}} \leq 1.0 \)
\[
\frac{674.35}{1026.79} + \frac{1181}{167.65} \leq 1.0
\]

0.727 < 1.0

Hence OK.

**Check for Shear Capacity:**

Maximum shear force due to wheel load, \(V_x = 594.36\ kN\)

Shear capacity = \(\frac{A_v f_y}{\sqrt{3}} \frac{1000}{7100} = \frac{(600 \times 11.2) \times 250}{\sqrt{3} \times 1.10 \times 10^3} = 881.77\ kN > 594.36\ kN\)

Maximum Shear, \(V = 594.36 < 0.6 \times V_d\)

\(< 0.6 \times 881.77\)

\(< 529.06\ kN\)

Since \(V = 0.6 \times V_d\), it is the case of high stress, hence no reduction in moment capacity.

**Check for Web buckling under wheel load:**

Maximum Wheel load = 388.56kN

Buckling resistance = \((b_t + n_l) t_w F_{cd}\)

Bearing length, \(b_t = 150\ mm\) (Assume wheel diameter)

\(n_l = \frac{600}{2} + 2 \times 7.6 = 315.2\ mm\)

Depth of I-section, \(h = 600\ mm\)

Slenderness ratio of the web, \(\lambda_w = 2.42 \frac{d_i}{t_w}\)

\(d_i = 600 - 2(21.3 + 17) = 523.4\ mm\)

\(t_w = 11.2\ mm\)

\(\lambda_w = 2.42 \times \frac{523.4}{11.2} = 113.09\)

Referring to Table 9.6C of IS800:2007,

for \(\lambda_w = 113.09\) and \(f_r = 250\ N/mm^2\),

\(F_{cd} = 110.80\ N/mm^2\)

\[\therefore\text{Buckling Resistance} = F_{cd} A = \frac{110.80 \times [(150 + 315.2) \times 11.2]}{10^5} = 577.29\ kN > 388.56\ kN\]

Hence OK.
Check for Deflection:

For EOT crane up to 500kN capacity, the deflection limit is $\frac{L}{750}$.

Static Load on each wheel on gantry girder = 207.24kN
Wheel base = 3m
Maximum bending moment occurs when the wheel is at 1.5m from support i.e when they symmetrically placed.

\[ 207.24\text{kN} \quad \text{C} \quad 207.24\text{kN} \]

\[
\begin{array}{c}
\text{1.5} \\
\text{6m} \\
\text{1.5m}
\end{array}
\]

\[
\text{310.86kN-m} \quad \text{310.86kN-m}
\]

\[
\text{Diagram}
\]

From Conjugate beam method, due to symmetry,

\[
R_A' = \frac{\text{Area of } M}{\frac{2EI}{2EI}} = 2 \left[ \frac{1}{2} \times 1.5 \times 310.86 \right] + \left[ 3 \times 310.86 \right] = \frac{466.29 + 932.58}{2EI} = \frac{699.44}{EI}
\]

\[ \therefore R_A' = \frac{699.44}{EI} \]

Maximum deflection occurs at mid span.

\[ \Delta_c = \text{Moment of } \frac{M}{EI} \text{ diagram about } C \]

\[ \Delta_c = \frac{1}{EI} \left[ (699.44 \times 3.0) - \left( \frac{1}{2} \times 310.86 \times 1.5 \times \left( \frac{2}{3} \times 1.5 \times 1.5 + 1.5 \right) \right) - \left( 1.5 \times 310.86 \times \frac{1.5}{2} \right) \right] \]
Outcome

One can be able to know design criteria of gantry girders

Future study

http://nptel.ac.in/courses/105103094/
Design of plate girders

Introduction

Objective

Design of bolted plate girder without stiffener
Design of welded plate girder without stiffener
Design of welded plate girder with end stiffeners
Design of welded plate girders with intermediate stiffeners

Outcome

Future Study
Introduction

In a plate girder bridge, the plate girders are typically I-beams made up from separate structural steel plates (rather than rolled as a single cross-section), which are welded or, in older bridges, bolted or riveted together to form the vertical web and horizontal flanges of the beam.

3.1.2 Objective

- To study the design criteria of plate girder with bolted, welded- with and without stiffeners

Plate girders

Plate girders became popular in the late 1800's, when they were used in construction of railroad bridges. The plates were joined together using angles and rivets to obtain plate girders of desired size. By 1950's welded plate girders replaced riveted and bolted plate girders in developed world due to their better quality, aesthetics and economy. Fig.7.15 shows the cross sections of two common types of plate girder bridges. The use of plate girders rather than rolled beam sections for the two main girders gives the designer freedom to select the most economical girder for the structure. If large embankment fills are required in the approaches to the bridge, in order to comply with the minimum head-room clearance required, the half through bridge is more appropriate [Fig.7.15 (a)]. This arrangement is commonly used in railway bridges where the maximum permissible approach gradient for the track is low. In this case the restraint to lateral buckling of compression flange is achieved by a moment resisting U-frame consisting of floor beam and vertical stiffness, which are connected together with a moment resisting joint. If the construction depth is not critical, then a deck-type bridge, as shown in Fig.7.15 (b) is a better solution, in which case the bracings provide restraint to compression flange against lateral buckling.

Design procedure for bolted plate girder

1. Computing the Factored load W in kN
   \[ W = 1.5 \text{DL} + 1.50 \text{LL} \]
   Where \( \text{DL} = \text{Dead Load} \)
   \( \text{LL} = \text{Live Load} \)

2. Computing the Self- Weight w in kN/m
   \[ w = \frac{W_r \text{L}}{200} \text{ to } \frac{W_r \text{L}}{300} \]
   where \( W_r \) = Factored load \( W + \text{Factored Self-weight} \)

3. Compute factored bending moment and Shear Force
   \[ M_d = W_r \text{L}^2 / 8 \quad \text{kN-m} \]
   \[ V_d = W_r \text{L} / 2 \quad \text{kN} \]
   Compute and Add BM due to Impact if required:
   \[ M = 0.372 W \text{L}^2 / 8 \quad \text{kN-m} \]

4. Finding the economical depth of plate girder
   \[ d = \sqrt[3]{\frac{M_d k}{f_y}} \]
5. Finding the optimum value of thickness of web
\[ t_w = \left( \frac{M}{k f_y} \right)^{1/3} \]
where \( k = \frac{d_w}{t_w} \)
\( f_y = 250 \text{ N/mm}^2 \)
For unstiffened web: \( \frac{d_w}{t_w} = 67 \)
To avoid buckling of the compression flange into web:
\( \frac{d}{t_w} \leq 345 \varepsilon^2 \)
When transverse stiffeners are not provided:
\( \frac{d}{t_w} \leq 200 \varepsilon \)
\( \varepsilon = \text{yield stress ratio of web} = \sqrt{\frac{250}{f_y}} \)
For Stiffened web with End Stiffeners only:
\( \frac{d}{t_w} = 100 \varepsilon \text{ to } 110 \varepsilon \)
For Stiffened web with End Stiffeners and Intermediate Stiffeners:
\( \frac{d}{t_w} > 200 \varepsilon \)
6. Design of Flanges:
   Width of flange \( b_f = 0.3d \)
   Thickness of flange:
   For Plastic section: \( t_r \leq 8.4 b_f \)
   For Compact section: \( t_r \leq 9.4 b_f \)
   For Semi-Compact section: \( t_r \leq 13.6 b_f \)
7. Check the moment capacity of section: \( M_d > M \)
8. Check for Shear strength of the section
9. Provide End and Intermediate stiffeners if required in case of thin webs.
10. Design the connections.

Outcome
- One can know the design criteria of plate girder with bolted, welded- with and without stiffeners

Future study
http://nptel.ac.in/courses/105103094/
